EDUCATION

Northeastern University – **Bachelor of Science in Computer Science** Expected May 2027 | GPA: 3.58

TECHNICAL SKILLS

Languages: JavaScript/TypeScript, Python, PHP, C/C++, Bash, SQL, Java, HTML/CSS

Frameworks & Testing: React, Node.js, Laravel, Django, Jest, Vitest, JUnit, PHPUnit

Data & Messaging: PostgreSQL, MongoDB, Redis, RabbitMQ

Infrastructure: Docker, Proxmox, AWS (EC2, Lightsail, S3), Nginx, Linux, Jenkins, Git/Bitbucket, Claude Code

EXPERIENCE

Software Engineer Co-op, OmniTrust (formerly ISS) – Boston, MA Jul. 2026 – Present

- Shipped interface aliasing feature to production release for device lifecycle management platform, allowing customers to remap cryptographic operations without reassigning identities system-wide
- Implemented aliasing across a distributed microservice architecture: new REST endpoints, RabbitMQ messaging to keep alias state consistent across dependent services and appliances, and schema migrations against existing customer records in production
- Iterated on technical design with a 9-engineer team inside a 50-person product organization, converting customer specifications into approved implementation plans
- Implemented and released customer-specified cryptographic operation sequences, including a ZIP archive integrity and safety validator since adopted as the standard pre-signing check for large archives across the codebase
- Diagnosed server memory exhaustion caused by a decompression library buffering entire archives in memory, then researched and recommended a streaming replacement for architectural approval
- Migrated legacy RPC interfaces to CRUD REST routes, backed by unit, integration, and end-to-end test coverage
- Demoed features to engineering teams and executives, reviewed and approved peer pull requests, and managed forward-merging of changes across concurrent release branches

Software Engineer Intern, Videeko Vanilla ZP – Boston, MA May 2025 – Dec. 2025

- Led development and deployment of a product traceability platform for roughly 100 users across US and Madagascar sites, replacing spreadsheet workflows with structured data entry, file upload, and audit logging
- Built role-based approval workflows tracking record state through sign-off checkpoints, surfacing product approvals and shipment tracking to the roles authorized to clear them across acquisition, manufacturing, and shipping sites
- Provisioned production and staging environments on AWS Lightsail behind an nginx reverse proxy with auto-renewing Let's Encrypt certificates and automated S3 backups; containerized local development with Docker
- Replaced an unreliable flight tracking integration with a new provider and removed redundant request logic, cutting operational costs by reducing polling to twice daily
- Gathered specifications from product and manufacturing managers, using iterative mockup demos to confirm requirements across language and time zone gaps before implementing or delegating across a 3-person team

Freelance Fullstack Developer, Minuteman Landscape Supply – Boston, MA Aug. 2025 – Present

- Designed and launched a live e-commerce and delivery platform serving 400+ registered users, replacing phone-only ordering and a paper calendar; own deployment, maintenance, and ongoing feature work
- Integrated Clover payments via webhook handlers reconciling order state against Clover records before confirming on site, with inventory synchronization and in-shop POS receipt printing
- Built delivery scheduling with per-slot capacity limits, overlapping zone routing, and automated email confirmations, unifying online orders with phone and walk-in orders staff enter directly
- Backed 15-minute booking holds with Redis TTL keys and session-persistent carts, cutting database reads and writes during checkout

PROJECTS

NBA Elo Engine | *Python, Pandas, SQL* Jan. 2025 – Feb. 2025

- Processed over 68,000 NBA games and implemented a modified Glicko-2 algorithm to compute player ratings

Sports Data Scraper | *Java, JavaFx, Jsoup, HTML* Sep. 2023 – Dec. 2023

- Developed a Java desktop application to interface with web scraped sports statistics, modeled in UML to identify dependencies and components prior to development
